- 7.4 编写函数int count()用于统计该函数调用的次数,编写函数int countSum(int x)用于对调用该函数的所有x求和。编写主函数用于求 2~300的素数,用count()统计素数个数,用countSum(x)求素数的总和(提示:每次判断出一个素数时就调用count()和countSum(x)进行统计,而 count()和countSum(x)内用静态局部变量进行统计,函数返回统计值)。
- 7.6 写出下列程序的运行结果:

```
# include <iostream>
using namespace std;
int a=9;
int main()
{    int b=3;
    cout<<a<<"\t"<<::a<<"\t"<<b<<endl;
    double a=7.8;
    cout<<a<<"\t"<<::a<<"\t"<<b<<endl;
    {       int a= -20; b+=a; cout<<a<<"\t"<<::a<<"\t"<<b<<endl; }
    cout<<a<<"\t"<<b<<endl; }
    return 0; }</pre>
```

```
7.7 写出下列程序的运行结果:
    # include <iostream>
    using namespace std;
    int n=100;
    int f1(int n){ int y=0,i; for(i=1;i<=n;i++) y+=i; return y; }
    int f2(){
                 static int y=0,i; for(i=1;i<=n;i++) y+=i; return y; }
    int main()
    { cout << f1(10) << "\t" << f2() << endl;
       n=10;
       cout << f1(100) << "\t" << f2() << endl;
       return 0;
7.8 写出下列程序的运行结果:
    # include <iostream>
    using namespace std;
    int f1(int n)
        static int s=0; s+=n; return s; }
    int f2(int n)
        int s=0; s+=n; return s; }
    int main()
        cout << f1(7) << "\t" << f2(7) << endl;
        cout << f1(8) << "\t" << f2(8) << endl; return 0;
```
